

维生素K2 Vitamin K2 MK-4 / MK-7

维生素K2不是单一的化合物,它是由一组必需的脂溶性维生素组成。他们的区别在于侧链中碳氢原子的数量饱和度不同,即“类异戊二烯”残基。这些差异在维生素K2基团中尤其明显,该基团包括侧链长度不同的甲萘醌。长度以特定的甲萘醌链的名称标记(例如:MK-4意味着4个类异戊二烯基团附着在主环上),长度影响它们到达体内不同组织的能力。

Vitamin K2 is not a single compound – it consists of a group of essential fat-soluble vitamins. They differ in the saturation and number of attached carbon-hydrogen atoms in the sidechain, called “isoprenoid residues.” These differences are especially pronounced in the vitamin K2 group, which includes menaquinones with different lengths of the side chain. The length is marked in the name of the particular menaquinone chain (ex: MK-4 means 4 isoprenoid residues are attached to the main ring), and the length influences their abilities to reach different tissues within the body.
